MedLink – Frontend Pages Plan

1. Initial Delivery – Required Pages

The following pages represent the essential frontend scope that should be delivered first for the project review. They cover the main patient journey and the doctor's core workflow.

A. Patient Interface

1. Login and Registration

- Patient login.
- New patient registration.
- Basic account validation.

2. Patient Dashboard

- Welcome section.
- Start a new medical assessment.
- View the next appointment.
- Quick access to important sections.

3. Symptom Selection

- Display the available symptoms.
- Allow patients to select one or more symptoms.
- Preserve the order in which symptoms are selected.

4. Medical Questionnaire

- Display dynamic medical questions based on the selected symptoms.
- Support different question types, such as single choice, multiple choice, number, duration, and scale.
- Display follow-up questions according to the patient's answers.
- Use one reusable questionnaire page rather than creating a separate page for every question.

5. Triage Results

- Display the preliminary urgency level: Emergency, Urgent, or Routine

- Display the suggested medical specialty.
- Show the appropriate guidance to the patient.
- Stop the appointment booking process if an emergency is detected.

6. Doctors Listing

- Display available doctors in the suggested specialty.
- Show doctor information, consultation fees, available appointments, and accepted insurance providers.
- Allow patients to compare and filter doctors.

7. Doctor Profile and Booking

- Display the selected doctor's profile and details.
- Show available appointment slots.
- Allow the patient to select a suitable appointment.

8. Booking Confirmation and Payment

- Display the selected doctor and appointment details.
- Allow the patient to confirm the booking.
- Display accepted insurance options.
- Support online payment only if the payment gateway is approved and included in the implementation scope.

B. Doctor Interface

9. Doctor Dashboard

- Display upcoming appointments.
- Show a summary of scheduled patients.
- Provide quick access to patient records.

10. Patient Medical Record

- Display the patient's medical history.
- Display submitted symptoms and questionnaire answers.
- Clearly distinguish patient-entered information from information verified by the doctor.

11. AI Analysis Review

- Display the AI-generated medical summary.
- Display possible differential diagnoses with supporting findings.
- Show missing medical information and suggested questions for the doctor.
- Allow the doctor to review and assess the AI-generated information.
- Keep all AI-generated content as suggestions, not confirmed diagnoses.

12. Clinical Consultation

- Allow the doctor to write clinical notes.
- Allow the doctor to record the final diagnosis.
- Allow the doctor to create prescriptions.
- Keep the doctor fully responsible for the final medical decision.

2. Later Development – Additional Pages

These pages are useful for the complete platform but are not essential for the initial project delivery.

A. Patient Interface

13. My Appointments

- View upcoming and previous appointments.

- View appointment details.

- Cancel or reschedule appointments if supported.

14. My Medical History

- View previous consultations.

- View confirmed diagnoses.

- View medical records and previous assessments.

15. Prescriptions and Reminders

- View prescribed medications.

- View medication instructions.

- Manage medication reminders.

16. Patient Profile and Settings

- Update personal information.

- Manage account settings.

- Manage language and notification preferences if supported.

B. Doctor Interface

17. Manage Availability

- Set working days and hours.
- Add or remove available appointment slots.
- Manage appointment availability.

18. Doctor Profile Settings

- Update professional information.
- Update consultation fees.
- Manage accepted insurance providers.

19. Patient Visit History

- View previous patient consultations.
- Review previous medical notes and diagnoses.

20. Prescription Management

- View previously issued prescriptions.
- Manage prescription records.

21. Audit History

- Review important system activities and changes, if the audit log feature is approved.

C. Hospital and Clinic Admin Interface

22. Admin Dashboard

- Display an overview of platform activity.

- Show appointment statistics.

23. Provider Profile Management

- Manage hospital or clinic information.

24. Departments Management

- Add, edit, and manage medical departments.

25. Doctors Management

- Add and manage doctors.

- Assign doctors to departments.

26. Schedules and Fees Management

- Manage doctors' schedules.

- Manage consultation fees.

27. Accepted Insurance Management

- Manage accepted insurance providers.

28. Appointments Overview

- View and monitor booked appointments across the hospital or clinic.

3. Pages and Features Not Required

To avoid unnecessary complexity and keep the project within a reasonable scope, the following should not be developed as separate pages or major features:

- A separate page for every medical question. The questionnaire should be dynamic and reusable.

- A separate page for every symptom. Symptoms should be selected from one shared symptom selection page.

- Patient-facing differential diagnosis results. Detailed AI hypotheses should be available to the doctor only.

- A Physician Advisors dashboard. Medical reviewers are not regular platform users.

- A complete hospital management system.

- Full insurance company integration. The initial scope only requires displaying accepted insurance providers and recording the patient's selection.

- In-platform chat or messaging.

- Doctor ratings and reviews.

- Complex Super Admin functionality.

4. Important Frontend Development Notes

1. **Initial Scope:** The first version focuses on Internal Medicine only.

2. **Web and Mobile:** The web application and Flutter application should follow the same main user journey and business requirements, while adapting the interface to each platform.

3. **Dynamic Questionnaire:** Both applications must use the same backend questionnaire logic. Medical branching rules should not be implemented separately in the frontend.

4. **Emergency Handling:** Emergency cases must interrupt the normal booking journey and display the appropriate emergency guidance.

5. **AI Responsibility:** AI results are preliminary decision-support information. They must never be presented as a confirmed medical diagnosis.

6. **Doctor Authority:** The doctor is responsible for reviewing the AI analysis and recording the final diagnosis.

7. **Language Support:** The interface should be designed with the possibility of supporting Arabic and English, including RTL layout. This requirement is still pending confirmation.

8. **Payment:** Online payment integration is not yet confirmed and should not be treated as a mandatory initial feature.

5. Recommended Delivery Scope

Interface	Initial Delivery	Later Development
Patient	8 pages	4 pages
Doctor	4 pages	5 pages
Hospital/Clinic Admin	0 pages	7 pages
Total	**12 pages**	**16 pages**

Recommendation: Start with the 12 initial pages. They cover the complete essential workflow, from patient registration and medical assessment to doctor review and clinical consultation. The remaining pages can be implemented in later development phases without blocking the core system.
